DRIVEWAYS

Over time most driveways will attract surface dirt as well as organic matter such as weeds, moss and algae. Not only does this look unsightly but it can also be a slip hazard to you or any visitors who walk on your drive. Clear and Clean offer high quality, professional cleaning for all forms of driveways, with over 30 years' experience to give you the best results.

Using the latest equipment on the market, we can offer the best services for your driveways. Our stainless-steel flat surface cleaner uses steam reaching temperatures up to 150 degrees and pressure as low as 80 bars. This eliminates any risks of damaging surface areas from high pressure at close range.

The hot steam, low pressure cleaning produces fantastic results, as well as killing any organic growth, leaving your driveway clean and hazard free. Once the area has been steamed, we can offer the option of applying a Professional Use Only Biocide to cleanse and prolong any form of regrowth.

We can also offer an alternative to flat surface cleaning with our Westermann Moss Brush. The Westermann is an industrial wire brush that removes thick moss and light weeds without the use of water or pressure. The rotational brush gets into the cracks and crevices of driveways, leaving loose organic matter which can be swept away.

STEAM CLEANING

Steam Cleaning is one of the safest ways to remove dirt and organic matter from any substrate without causing damage to the surface. The low pressure, high temperature cleaning process is particularly useful for cleaning delicate surface areas such as brick walls, patios and boundary walls.

Steam cleaning is a great alternative to pressure washing. Although pressure washing may look clean at first glance, the spores will remain deep within the substrates. Moss, Algae and Lichens are all living organism that need sunlight, oxygen and water to grow. By using a pressure washer with cold water, you are only feeding the problem, as-well as harming your substrates by using too much pressure. Steam on the other hand, uses high temperatures to kill the organic growth, delaying any forms of re-growth.

Steam is also highly effective for removing grease, oil, paint and chewing gum.
